“Modernizr is an essential part of my toolkit of files.”  
— Andy Clarke, *Stuff & Nonsense*

**Modernizr** is an open-source JavaScript library that helps you build the next generation of HTML5 and CSS3-powered websites.

## Why use Modernizr?

Taking advantage of the new capabilities of HTML5 and CSS3 can mean sacrificing control over the experience in older browsers.

Modernizr 2 is your starting point for making the best websites and applications that work exactly right no matter what browser or device your visitors use.

Thanks to the new Media Query tests and built-in [YepNope.js](#) micro-library as `Modernizr.load()`, you can now combine feature detection with media queries and conditional resource loading. That gives you the power and flexibility to optimize for every circumstance.

Check out the [full list of features](#) that Modernizr detects, or learn more about [conditional resource loading with Modernizr](#).

## Download Modernizr 2.5.3

Use the commented, uncompressed Development version to develop with and learn from.

[View documentation](#)

**DEVELOPMENT**

Uncompressed, 42 Kb

Then, dive into the Production build tool and pick just the tests you need!

**PRODUCTION**

Configure Your Build

## Get started with Modernizr

While Modernizr gives you finer control over the experience through JavaScript-driven feature detection, it is important to continue to use best practices throughout your development process. Use progressive enhancement wherever you can, and don't sacrifice accessibility for convenience or performance.

## HTML5 BOILERPLATE IS 3.0!

MONDAY, FEB 6TH, 2012

The key feature of this update is making Boilerplate smaller. Most of the changes have been working towards that. We have significant work done to our build script, so much so that we thought it **deserved its own repository**. Meanwhile, here is what's new.

### CHANGELOG

3.0 gets some major updates [Here are all the commits since last release.](#)

[Should you upgrade existing sites?](#) Short answer: nah, you're good.

# HTML5 & FRIENDS

**HTML5** is the set of technology standards that support the next phase in the development of the Web. From its beginning, Mozilla has championed Web standards to ensure freedom of choice for those who use the Web and independence for those who build it. Leaders from Mozilla helped start the evolution of HTML and related standards that is now known as HTML5, and Mozilla continues to lead in both defining and implementing these standards.

The term “HTML5” has been applied to many things, creating confusion about exactly what it is and what it can do. Rather than split hairs, we use “& friends” to encompass all the “new, exciting Web technologies” that will enable the next wave of Web-based innovation.

### HTML5 Audio Read-Along Demo

[Read the background and instructions for this demo.]

Luke 2:1-20 (ESV)

In those days a decree went out from Caesar Augustus that all the world should be registered. This was the first registration when Quirinus was governor of Syria. And all went to be registered, each to his own town. And Joseph also went up from Galilee, from the town of Nazareth, to Judea, to the city of David, which is called Bethlehem, because he was of the house and lineage of David. To be
